

What is SphenoCath®?

A new patented device and method for achieving an SPG block (sphenopalatine ganglion block), the SphenoCath® device and procedure provides most patients with immediate relief of headache pain with a simple, gentle, comfortable in-office procedure.

How is SphenoCath® Different?

The SphenoCath® device is a one-of-a-kind patented, soft, flexible, catheter through which a medical professional can deliver medication through the nasal passages to several difficult-to-reach ganglia (a group of nerve cells) in the face and head without needles, sprays, swabs or sedation for maximum patient comfort. This device allows a low risk, simple procedure that is a pain management game-changer for anyone who experiences four or more severe headaches a year.

FAQs

Why will an SPG block help me?

The sphenopalatine ganglion is a collection of nerve cells located just under the tissue lining the back of the nose. By applying a local anesthetic to the area, nerve impulses can be temporarily blocked, providing relief from various types of pain. SphenoCath® is designed to quickly and comfortably deliver medication to the area of the sphenopalatine ganglion.

How long will it take?

SPG block using the SphenoCath® takes 2-3 minutes. Patients are encouraged to remain in a flat or reclined position for 10-15 minutes afterwards to maximize the benefit of the procedure.

What are the side effects or risks with the SphenoCath®?

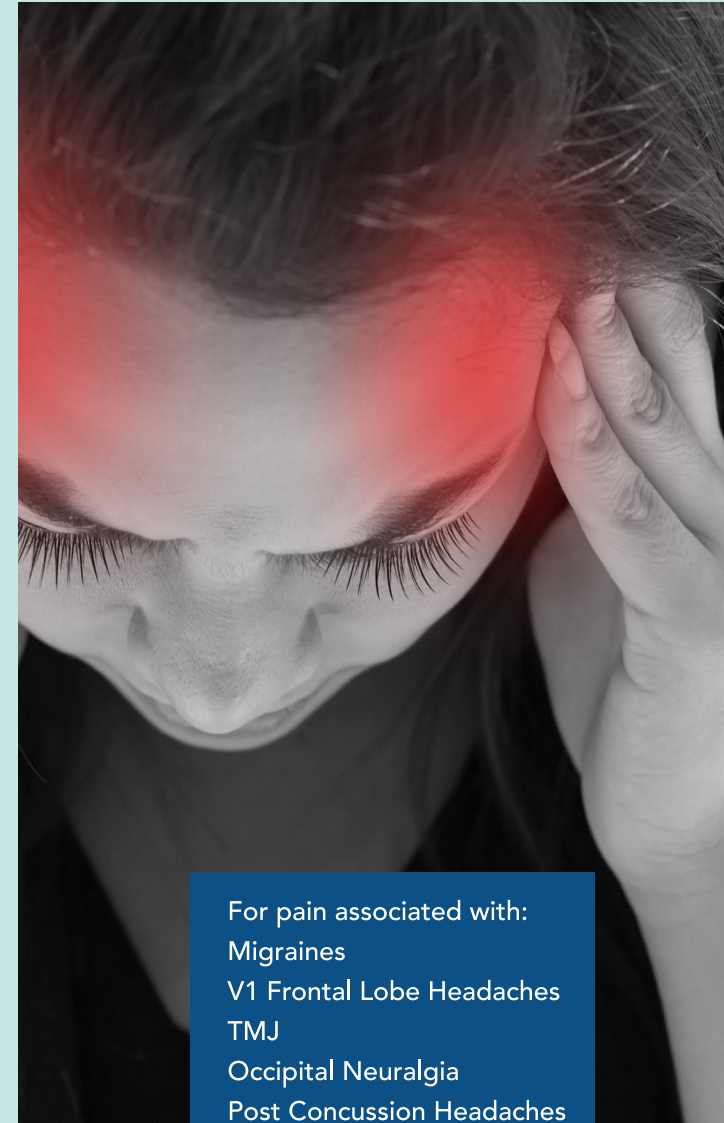

The risks of using the SphenoCath® include irritation to nasal cavity or mucosa, nose bleeding; and/or mild pain.
